

ChatGPT Reflection

I have mixed feelings about using ChatGPT for help with this assignment. It was very useful for when I couldn't remember the exact command in TypeScript or method of doing something and did not want to scour through Google wasting time to maybe not even find what I was looking for. It was also useful for catching smaller bugs but one of the times I was running into an issue it was not helpful at all and each time I said that the solution it provided was wrong it would only slightly change it and then when I said THAT was wrong as well it would modify it back to something very similar to what its original answer was. I also berated it and cursed it out and tried to make it feel shameful for leading me astray, but that did not work either. I found it odd because its knowledge base on TypeScript is pretty large so I imagined it wouldn't get so caught up on what ended up being a small issue.
